US Application No.: 10/057,221 Date of Response: December 2, 2005 Date of Action: October 5, 2005

SP02-014

The listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims:

What is claimed is:

1. (currently amended) A method of manufacturing a polarizing glass article comprising the steps of:

melting a glass batch in which a metal that form a polarizing layer of the glass article is essentially emitted, the metal being selected from the group consisting of silver and copper, the glass batch containing a halide capable of precipitating silver or copper halide:

cooling and shaping the melt into a glass article;

ion-exchanging silver or copper metal into the surface of the glass article;

subjecting the glass article to an elevated temperature for a period of time sufficient to generate and precipitate silver or copper halide crystals in a surface layer of the glass;

elongating the glass article under stress at a temperature above the annealing point of the glass to elongate the crystals in the direction of the stress; and

exposing the elongated glass article to a reducing atmosphere at an elevated temperature to initiate reduction of at least a portion of the silver or copper halide crystals to silver metal;

wherein the ion exchange occurs after cooling and shaping the melt into an article and before subjecting the glass article to an elevated temperature treatment for a period of time sufficient to generate and precipitate silver or copper halide crystals in a surface layer of the glass.

2. (previously amended) The method of claim 1, wherein the article contains a central layer containing essentially no silver or copper halide crystals.

SP02-014

- 3. (original) The method of claim 1, wherein the surface layer is less than 50 microns thick.
- 4. (original) The method of claim 1, wherein the surface layer is less than 10 microns thick.
- 5. (original) The method of claim 1, wherein the concentration of silver or copper metal in the surface layer is greater than 0.1% by weight.
- 6. (original) The method of claim 1, wherein the concentration of silver or copper metal in the surface layer is greater than 0.5% by weight.
